

No More Flooded Floors with the DEMA WATCH GUARD™ Float Valve System

Hang-ups and flooded floors are a thing of the past with WATCH GUARD's water valve activation system's superior design.

For this unique reservoir-mounted float valve system, the float is filled with water-soluble material, unlike competitors' system-clogging sand. Also, the 90° chemical barb rotates 180°, resulting in a "no-kink" chemical pick-up tube. Again, competition uses easy-to-kink straight barbs.

And the system provides great flexibility as an on/off valve is included with all 440 chemical series systems. Each-and-every unit is supplied with a metering tip kit with competitive cross-references. The standardized-sized mounting bracket makes it easy to convert from others' systems. The 1055B backflow requirements are met by the DEMA ACTION GAP™ back flow preventer easily fitted due to its small-than-normal profile.
